DESCRIPTION:

ResinlabTM EP1199 Black is a two part unfilled epoxy adhesive designed for bonding of metals, ceramics and most plastics. This product gives good resistance to water, salt spray, inorganic acids and bases and most organic solvents. This product gives better water and temperature resistance than standard 5 minute epoxy.

It was especially formulated to a 1:1 mix ratio for use in either MMD equipment or side by side dual cartridges for easy dispensing. A handling cure is normally achieved at room temperature within 30 - 60 minutes with full cure in 24 hours. An elevated temperature cure schedule can be used to reach final properties quickly.

TYPICAL PROPERTIES:

All properties given are at 25°C unless otherwise noted.

PROPERTY:		VALUE:	TEST METHOD:
Color		Black	
Viscosity RVT, #5, 2.5 RPM RVT, #4, 2.5 RPM	Part A Part B Mixed	15,000 cps (mPa⋅s) 3,000 cps (mPa⋅s) 9,000 cps (mPa⋅s)	TM R050-12
Specific Gravity	Part A Part B Mixed	1.16 0.97 1.06	TM R050-16
Pot Life Mass		8-12 min. 50 grams	TM R050-19
Hardness Scale		80 Shore-D	TM R050-17
Water Absorption 24 hours		0.28 %	TM R050-35
Temperature Range**		-40 to 150°C

INSTRUCTIONS:

1) Bring both components to room temperature prior to mixing. Mix 1 parts A to 1 part B thoroughly.

- 2) Allow to cure undisturbed until product is fully gelled or tack-free to the touch.
- 3) Clean up uncured resin with suitable organic solvent such as MEK, acetone or a chlorinated.solvent.

SIDE - BY - SIDE CARTRIDGE SUITABILITY RATING

POOR FAIR AVERAGE GOOD EXCELLENT

This rating scale is a general guideline to give the user an expected level of success in a typical bench-top dispensing scenario.

Important process variables to consider are: Cartridge type and size, wall thickness; manual or pneumatic gun type; static mixer design and dimensions; product viscosity spread and ratio; shot size, shot frequency, flow rate; temperature range during use.

This scale also address's product stability in a cartridge. Factors such as filler content and settling rate, storage temperature and cartridge orientation are important factors which affect this.

It is important for the user to define the optimum static mix for each dispensing process, a change in any of the above variables can affect the mix quality. Dispensing the product on a flat surface using the dispensing pattern can help show the quality of mixing in terms of thoroughness and lead/lag consistency.

MIX RATIO:	Part A to B	
	by weight	100 to 85
	by volume	1 to 1

* Asterisk denotes values considered typical to associated resin systems or extrapolated from other test results.

** Temperature Rating is based on average design requirements and is not intended as a guarantee of suitability for all applications operating at that temperature.

Notes:

Values presented above are considered to be typical properties, not to be used for specification purposes. Contact our Technical Department for further information.

Many epoxy resin systems are prone to crystallization as epoxy resin is a super-cooled fluid. This condition may give the product a gritty or grainy appearance (or hazy in clear products). In extreme cases it may appear solid and cured. Fluctuating temperatures (within 0 to 50°C) aggravate this phenomena. Heating to 50 to 60°C with stirring can usually restore products. Storage at 25 +/- 5°C is optimum for most products.

SHELF LIFE:

12 months
